

## ABSTRACT OF THE DISCLOSURE

An object of the present invention is to provide a map display device that makes full use of historic records of the input addresses of previously retrieved points, thereby simplifying the process for inputting an address of a point near a previously retrieved point and thereby facilitating easy point retrieval. The map display device for retrieving a point at an input address and for displaying a map that covers the retrieved point includes storage means for storing historic records of the input addresses of the previously retrieved points in a hierarchy of administrative district levels, and a control means for displaying an input page through which an address is input on an administrative hierarchical basis as well as for displaying an administrative district name of a previously retrieved point as a hierarchy of administrative levels or item fields.
